

Here are some example of command line prompts to use on my file:

- `Python affine.py < test-encrypt`
- `Python affine.py < test-decrypt`
- `Python affine.py < test-decipher`

And here's an example of the content within those files:

- `encrypt plaintext.txt encrypt-out.txt 5 8`
- `decrypt ciphertext.txt decrypt-out.txt 5 8`
- `decipher ciphertext.txt decipher-out.txt words.txt`

Important:

- The `all_characters.txt` file will have to be in the same file directory because I read from it so it is able to be used by the functions in my code.
